

Lecture 13

More dynamic programming!

Longest Common Subsequences, Knapsack two ways
(and if time independent sets in trees).

Announcements

- HW5 due tomorrow!

Last time

Dynamic Programming!

- Not coding in an action movie.

Last time

Dynamic Programming!

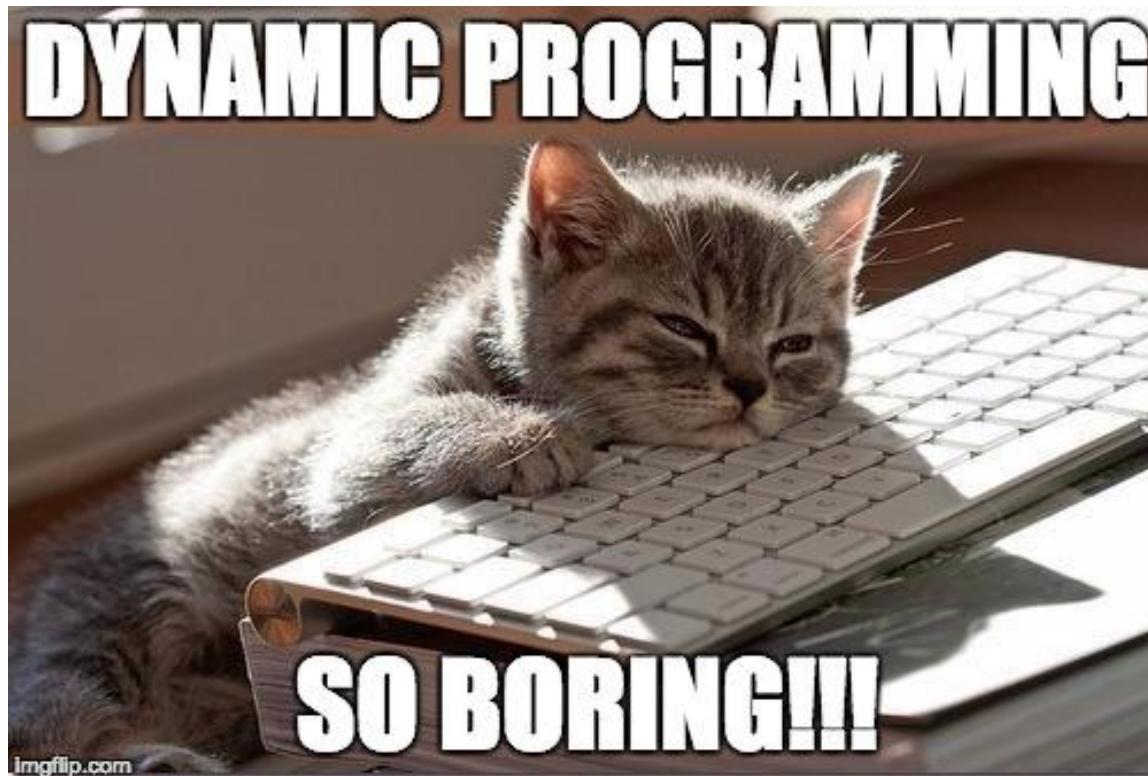

- Dynamic programming is an **algorithm design paradigm**.
- Basic idea:
 - Identify **optimal sub-structure**
 - Optimum to the big problem is built out of optima of small sub-problems
 - Take advantage of **overlapping sub-problems**
 - Only solve each sub-problem once, then use it again and again
 - Keep track of the solutions to sub-problems in a table as you build to the final solution.

Today

- Examples of dynamic programming:
 1. Longest common subsequence
 2. Knapsack problem
 - Two versions!
 3. Independent sets in trees
 - If we have time!
 - If not, that's okay, and the slides will be there as a reference!
- Yet more examples of DP in Algorithms Illuminated!
 - Weighted Independent Set in Paths
 - Sequence Alignment
 - Optimal Binary Search Trees

The goal of this lecture

- For you to get **really bored** of dynamic programming

Longest Common Subsequence

from your pre-lecture exercise!

- How similar are these two species?

DNA:

AGCCCTAACGGGCTACCTAGCTT

DNA:

GACAGCCTACAAGCGTTAGCTTG

Longest Common Subsequence

from your pre-lecture exercise!

- How similar are these two species?

DNA:

AGCCCTAA**GGG**GCTACCTAGCTT

DNA:

GAC**AGCCTA**CAAGCG**TTAGCTT**G

- Pretty similar, their DNA has a long common subsequence:

AGCCTAAGCTTAGCTT

Longest Common Subsequence

from your pre-lecture exercise!

- Subsequence:
 - BDFH is a **subsequence** of ABCDEFGH
- If X and Y are sequences, a **common subsequence** is a sequence which is a subsequence of both.
 - BDFH is a **common subsequence** of ABCDEFGH and of ABDFGHI
- A **longest common subsequence**...
 - ...is a common subsequence that is longest.
 - The **longest common subsequence** of ABCDEFGH and ABDFGHI is ABDFGH.

We sometimes want to find these

- Applications in **bioinformatics**

- The unix command `diff`
- Merging in version control
 - `svn`, `git`, etc...

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure. 
- **Step 2:** Find a **recursive formulation** for the length of the longest common subsequence.
- **Step 3:** Use **dynamic programming** to find the length of the longest common subsequence.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can **find the actual LCS**.
- **Step 5:** If needed, **code this up like a reasonable person**.

Step 1: Optimal substructure

- You thought about this on your pre-lecture exercise!
- Any thoughts?

Share what you
thought of with your
neighbor!

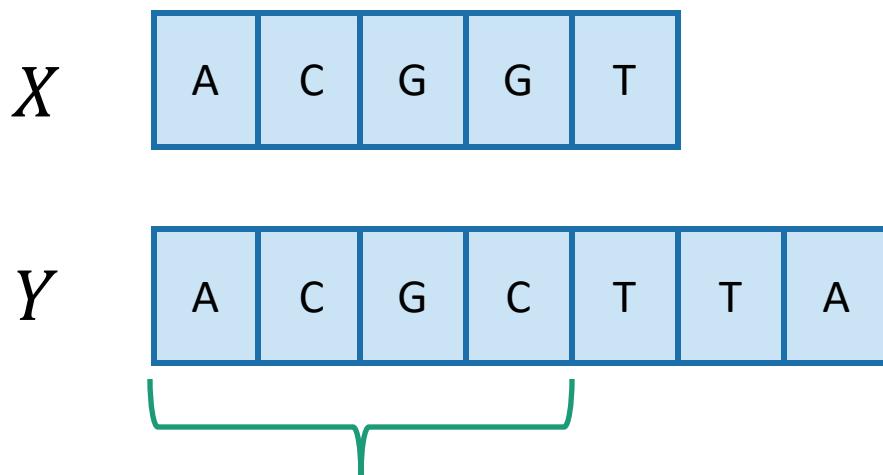

What we want:

- An optimal solution to the big problem builds on optimal solutions to the sub-problems
- We can use the same sub-problem again and again

Step 1: Optimal substructure

Prefixes:

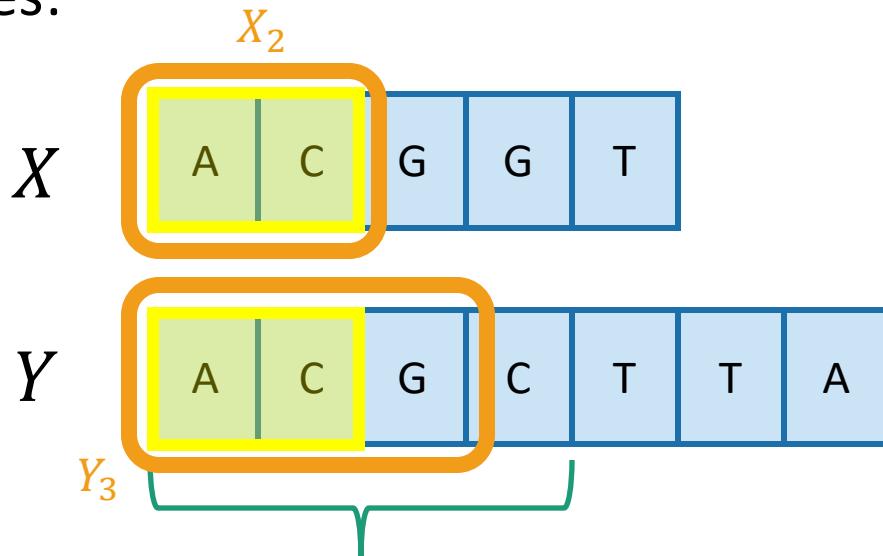

Notation: denote this prefix $ACGC$ by Y_4

- Our sub-problems will be finding LCS's of prefixes to X and Y .
- Let $C[i,j]$ be the length of the LCS between X_i and Y_j

Step 1: Optimal substructure

Prefixes:

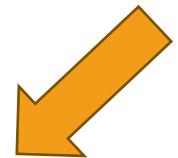

Example: $C[2,3] = 2$

Notation: denote this prefix $ACGC$ by Y_4

- Our sub-problems will be finding LCS's of prefixes to X and Y .
- Let $C[i,j]$ be the length of the LCS between X_i and Y_j

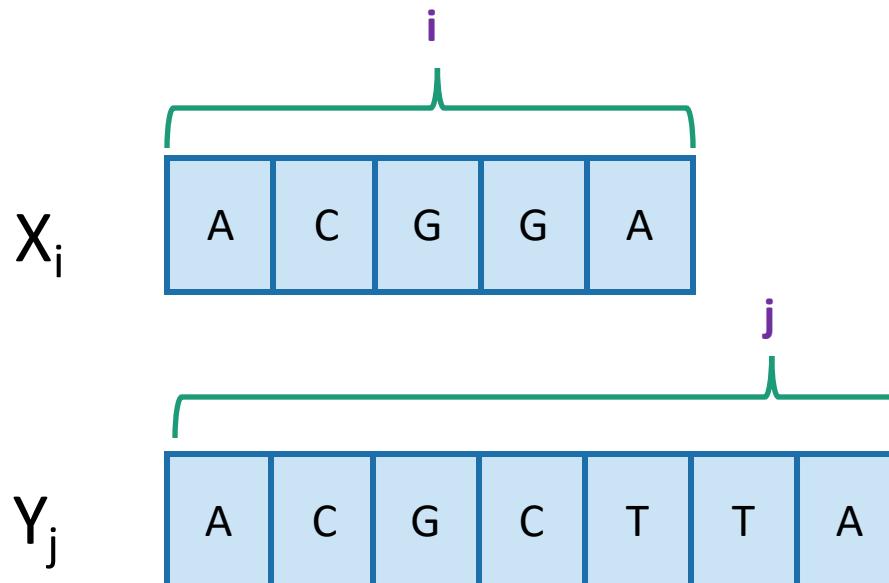

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the length of the longest common subsequence.
- **Step 3:** Use dynamic programming to find the length of the longest common subsequence.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual LCS.
- **Step 5:** If needed, code this up like a reasonable person.

Goal

- Write $C[i,j]$ in terms of the solutions to smaller sub-problems

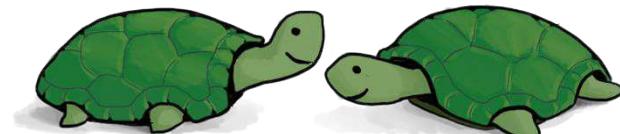

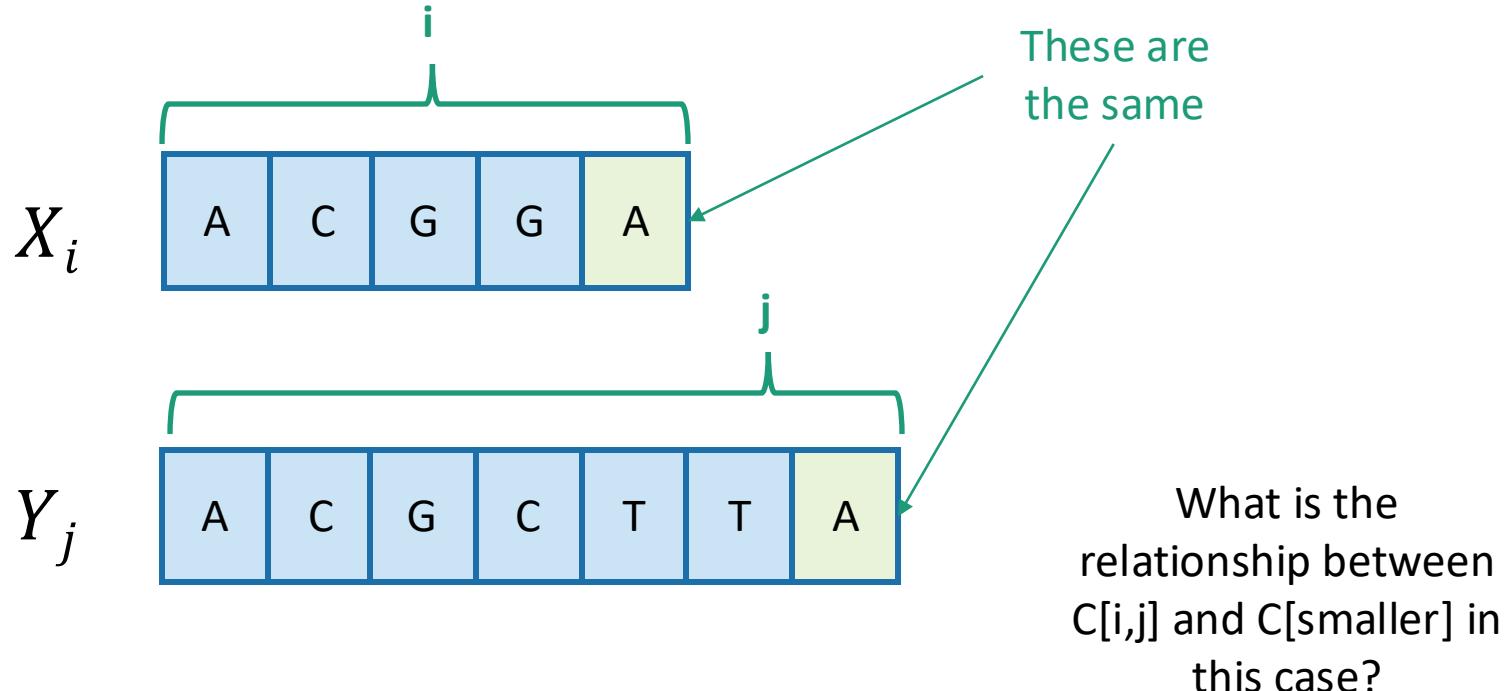

$C[i,j] = \text{length of LCS between } X_i \text{ and } Y_j$

Two cases

Case 1: $X[i] = Y[j]$

- Our sub-problems will be finding LCS's of prefixes to X and Y.
- $C[i,j] = \text{length of } \text{LCS}(X_i, Y_j)$

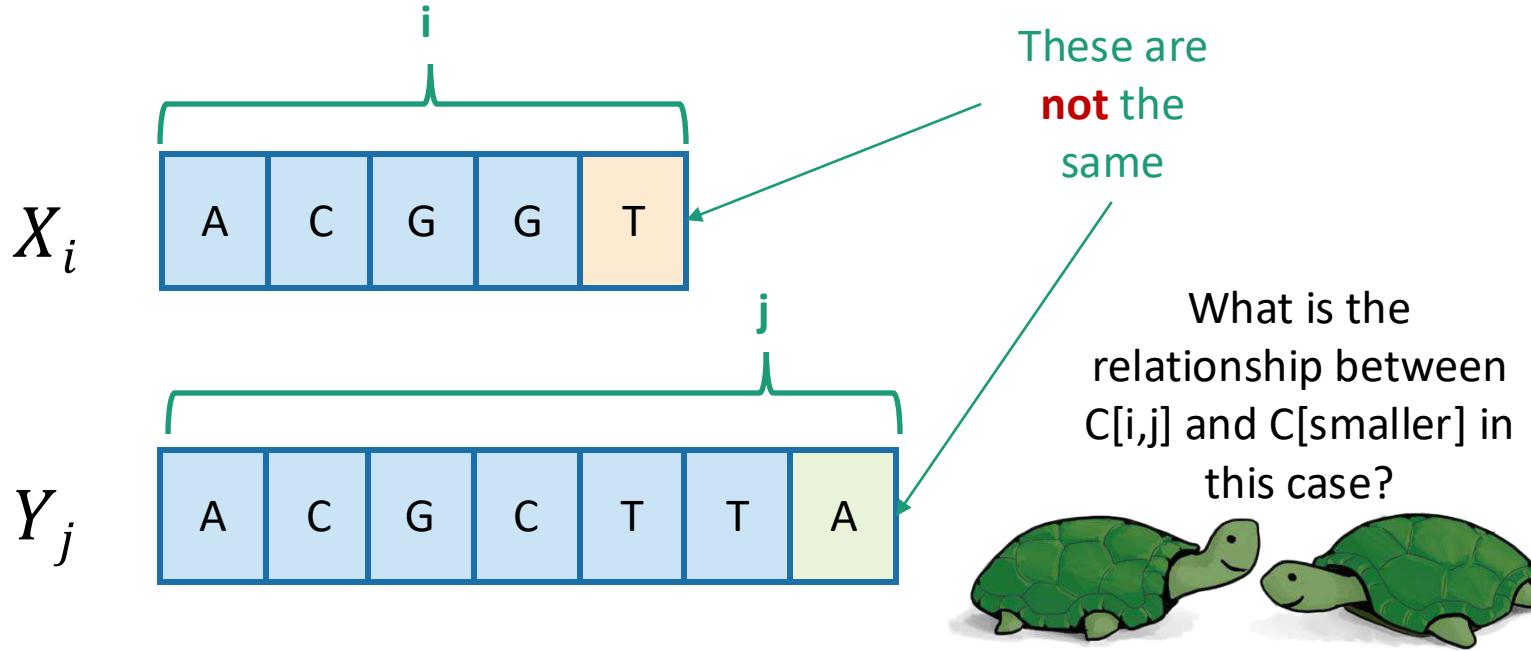

- Then $C[i,j] = 1 + C[i-1,j-1]$.

- because $\text{LCS}(X_i, Y_j) = \left\{ \text{LCS}(X_{i-1}, Y_{j-1}) \text{ followed by } \boxed{A} \right\}$

Two cases

Case 2: $X[i] \neq Y[j]$

- Our sub-problems will be finding LCS's of prefixes to X and Y.
- $C[i,j] = \text{length of } \text{LCS}(X_i, Y_j)$

- Then $C[i,j] = \max\{ C[i-1,j], C[i,j-1] \}.$
 - either $\text{LCS}(X_i, Yj) = \text{LCS}(X_{i-1}, Yj)$ and T is not involved,
 - or $\text{LCS}(X_i, Yj) = \text{LCS}(X_i, Y_{j-1})$ and A is not involved,
 - (maybe both are not involved, that's covered by the "or").

Recursive formulation of the optimal solution

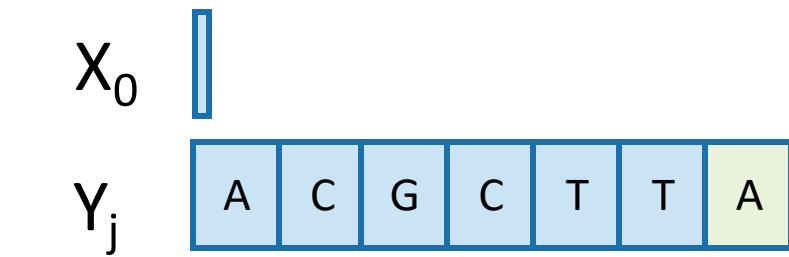

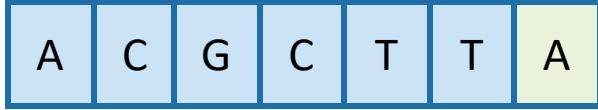

$$\cdot C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j - 1], C[i - 1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

Case 1

X_i

Y_j

Case 0

if $i = 0$ or $j = 0$

if $X[i] = Y[j]$ and $i, j > 0$

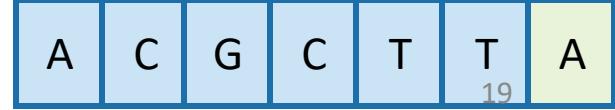

if $X[i] \neq Y[j]$ and $i, j > 0$

Case 2

X_i

Y_j

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the length of the longest common subsequence.
- **Step 3:** Use dynamic programming to find the length of the longest common subsequence.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual LCS.
- **Step 5:** If needed, code this up like a reasonable person.

LCS DP

- **LCS(X, Y):**

- $C[i,0] = C[0,j] = 0$ for all $i = 0, \dots, m, j=0, \dots, n$.

- **For** $i = 1, \dots, m$ and $j = 1, \dots, n$:

- **If** $X[i] = Y[j]$:

- $C[i,j] = C[i-1,j-1] + 1$

- **Else:**

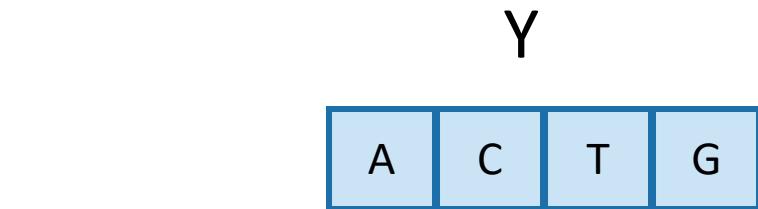

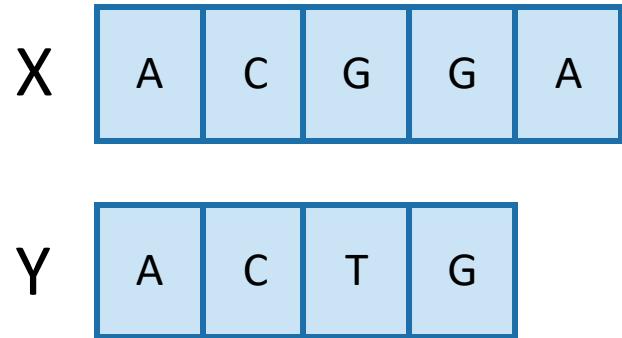

- $C[i,j] = \max\{ C[i,j-1], C[i-1,j] \}$

- Return $C[m,n]$

*Running time:
 $O(nm)$*

$$C[i,j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i-1,j-1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i,j-1], C[i-1,j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

$$C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j - 1], C[i - 1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

if $i = 0$ or $j = 0$

if $X[i] = Y[j]$ and $i, j > 0$

if $X[i] \neq Y[j]$ and $i, j > 0$

Example

- Once we've filled this in, we can work backwards.

$$C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j - 1], C[i - 1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

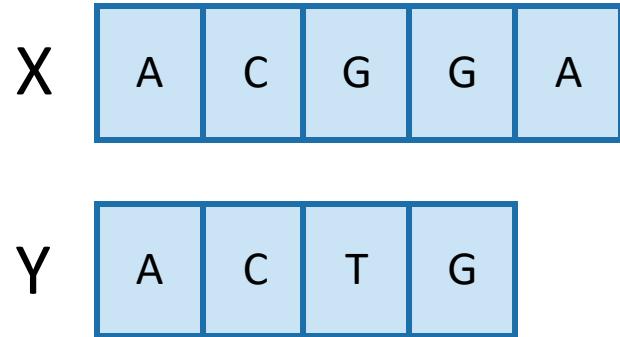

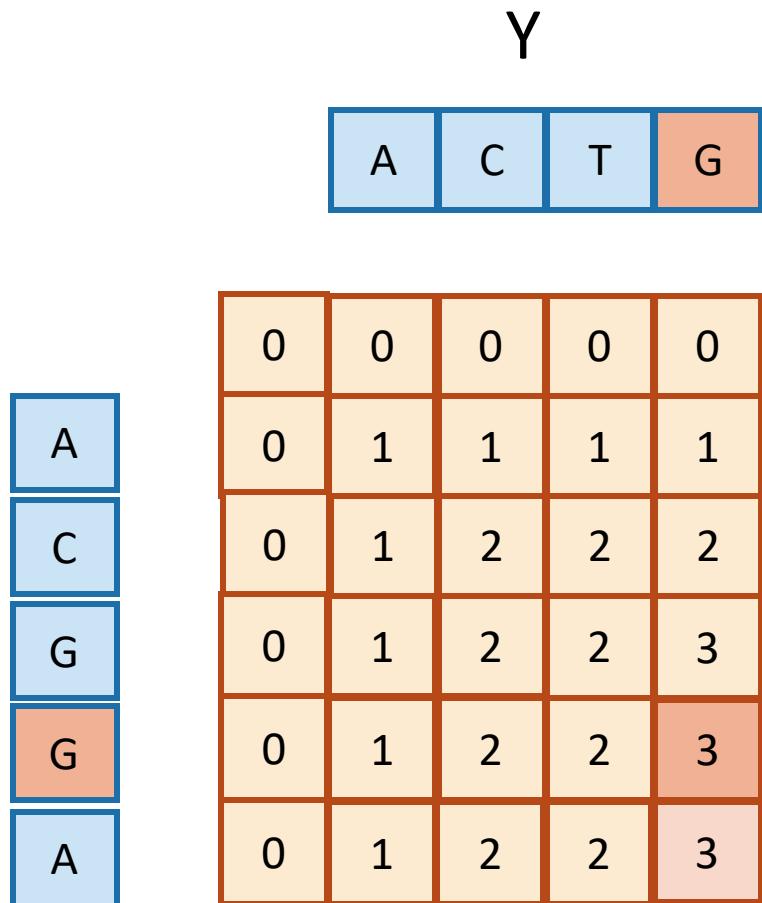

if $i = 0$ or $j = 0$

if $X[i] = Y[j]$ and $i, j > 0$

if $X[i] \neq Y[j]$ and $i, j > 0$

34

Example

- Once we've filled this in, we can work backwards.

That 3 must have come from the 3 above it.

$$C[i,j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i-1, j-1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j-1], C[i-1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

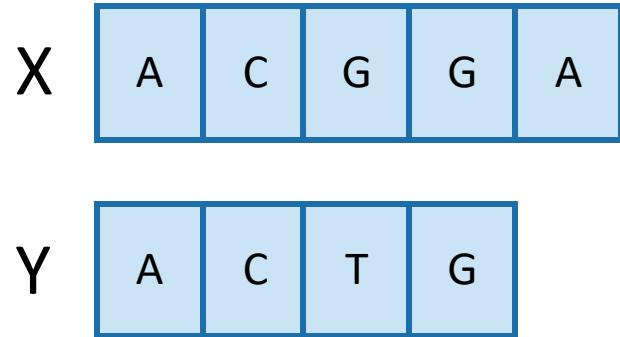

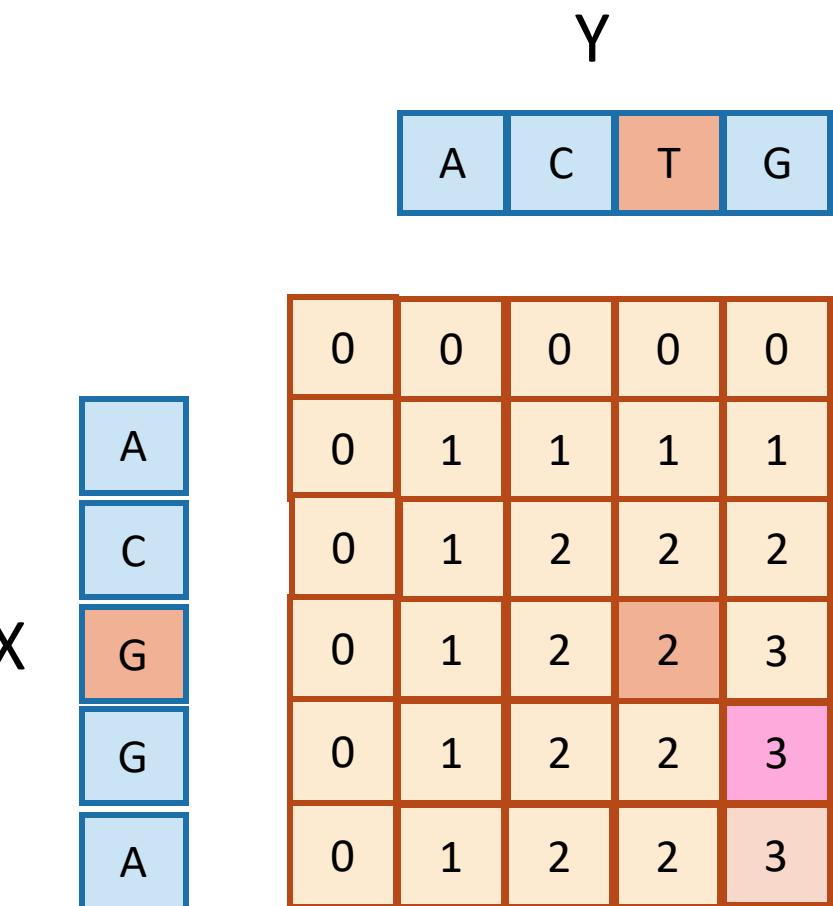

if $i = 0$ or $j = 0$

if $X[i] = Y[j]$ and $i, j > 0$

if $X[i] \neq Y[j]$ and $i, j > 0$

35

Example

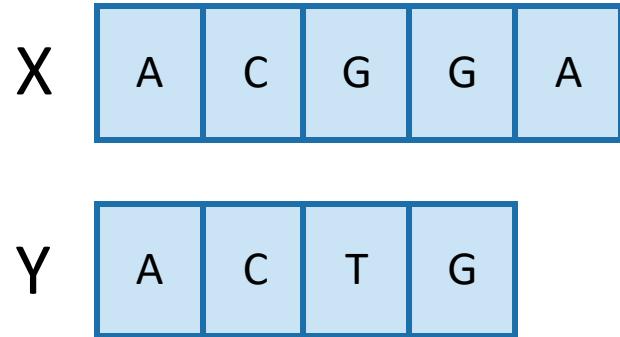

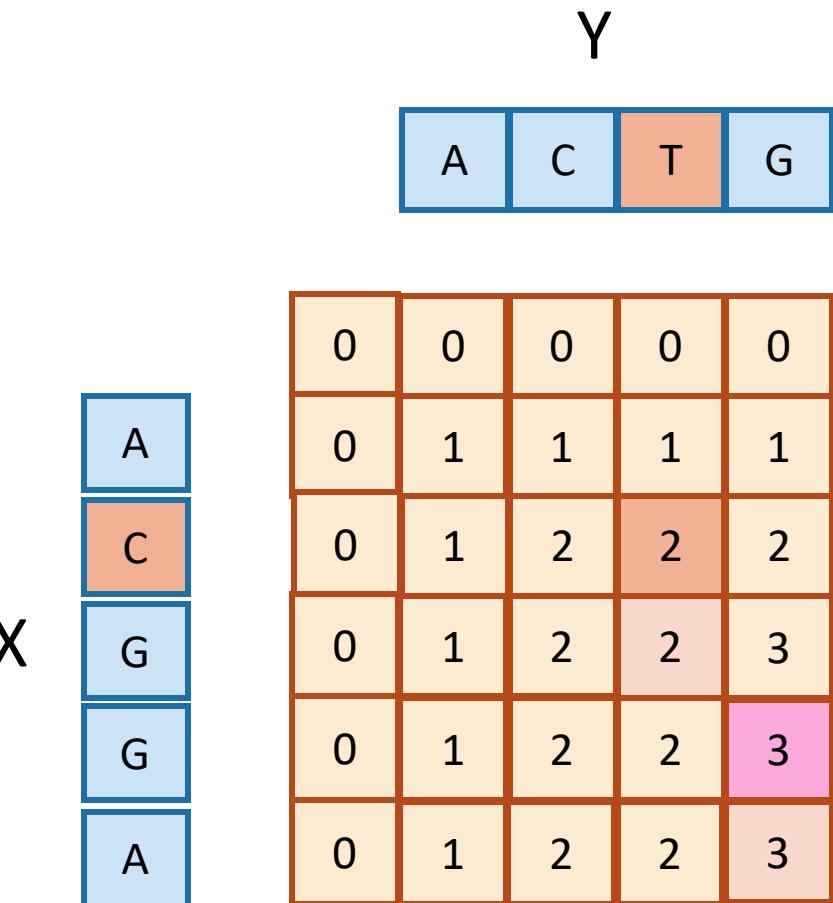

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

This 3 came from that 2 – we found a match!

$$C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j - 1], C[i - 1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

Example

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

That 2 may as well have come from this other 2.

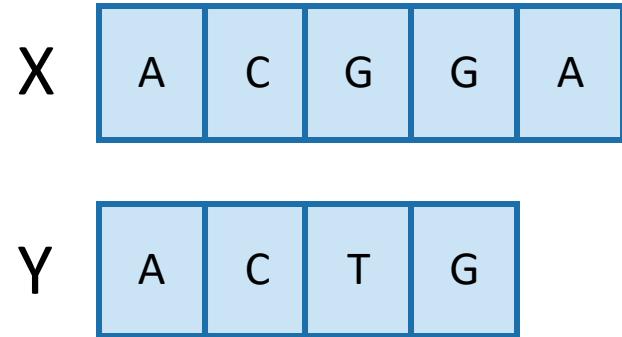

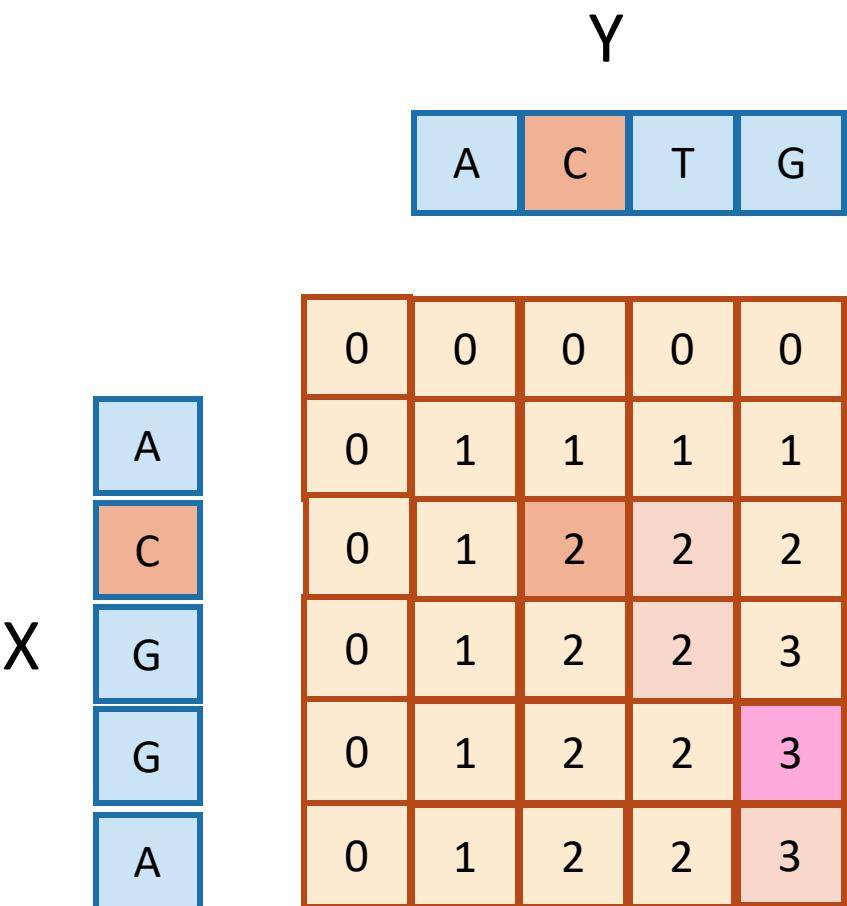

$$C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j - 1], C[i - 1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

if $i = 0$ or $j = 0$

if $X[i] = Y[j]$ and $i, j > 0$

if $X[i] \neq Y[j]$ and $i, j > 0$

Example

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

G

$$C[i,j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i-1, j-1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j-1], C[i-1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

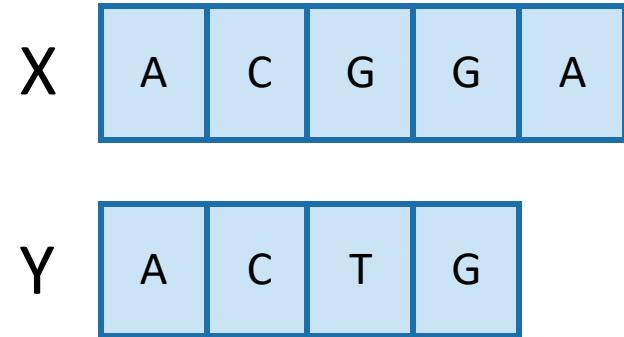

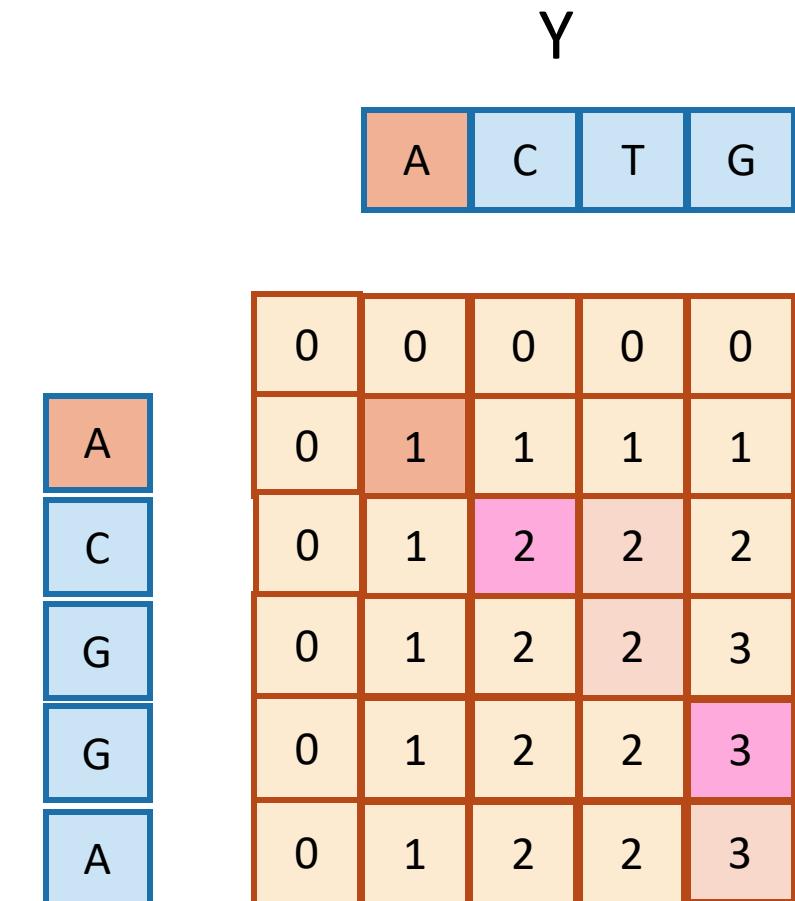

if $i = 0$ or $j = 0$

if $X[i] = Y[j]$ and $i, j > 0$

if $X[i] \neq Y[j]$ and $i, j > 0$

38

Example

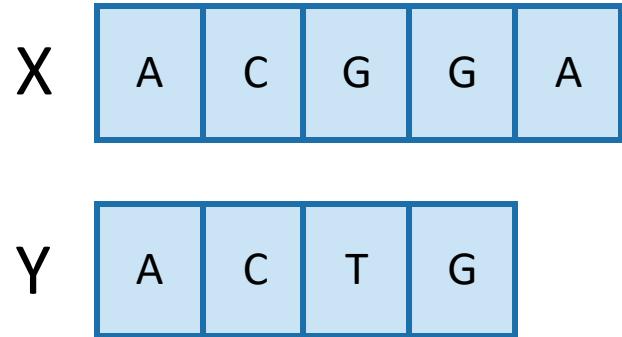

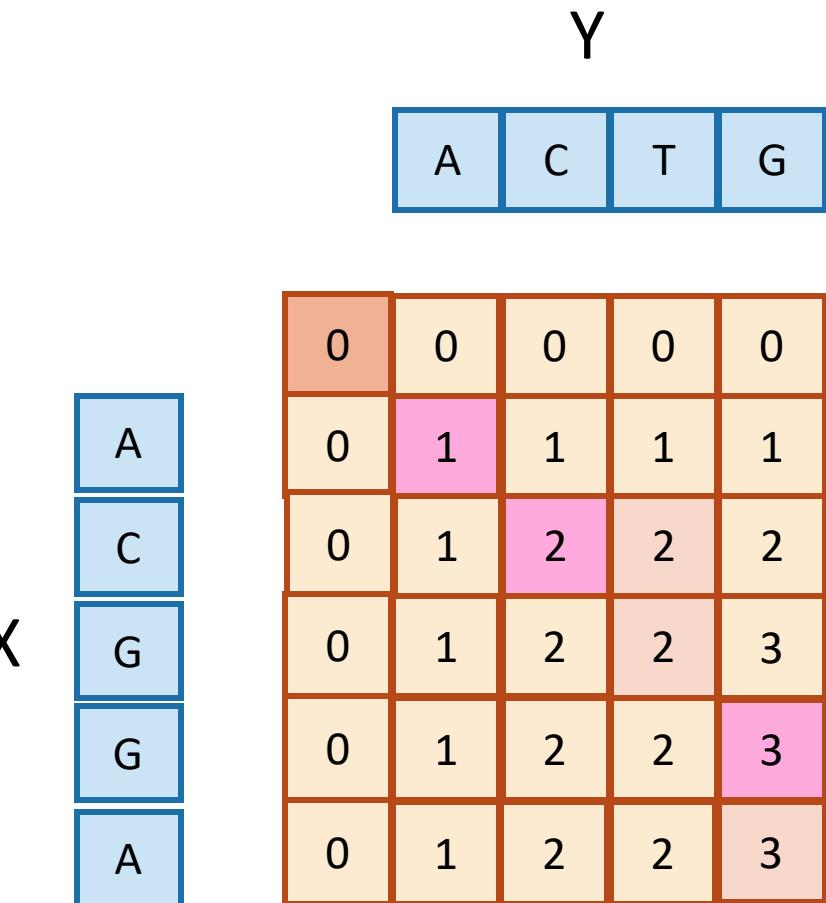

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

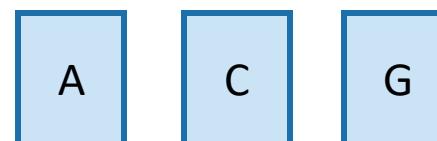

C G

$$C[i,j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i-1, j-1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j-1], C[i-1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

Example

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

This is the LCS!

$$C[i,j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i-1, j-1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{ C[i, j-1], C[i-1, j] \} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

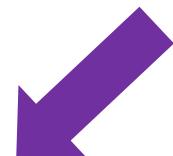

40

Finding an LCS

- Good exercise to write out pseudocode for what we just saw!
 - Or you can find it in CLRS.
- Takes time $O(mn)$ to fill the table
- Takes time $O(n + m)$ on top of that to recover the LCS
 - We walk up and left in an n -by- m array
 - We can only do that for $n + m$ steps.
- Altogether, we can find $\text{LCS}(X, Y)$ in time $O(mn)$.

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the length of the longest common subsequence.
- **Step 3:** Use dynamic programming to find the length of the longest common subsequence.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual LCS.
- **Step 5:** If needed, code this up like a reasonable person.

Our approach actually isn't so bad

- If we are only interested in the length of the LCS we can do a bit better on space:
 - Since we go across the table one-row-at-a-time, we can only keep two rows if we want.
- If we want to recover the LCS, we need to keep the whole table.
- Can we do better than $O(mn)$ time?
 - A bit better.
 - By a log factor or so.
 - But doing much better (polynomially better) is an open problem!
 - If you can do it let me know :D

What have we learned?

- We can find $\text{LCS}(X,Y)$ in time $O(nm)$
 - if $|Y|=n$, $|X|=m$
- We went through the steps of coming up with a dynamic programming algorithm.
 - We kept a 2-dimensional table, breaking down the problem by decrementing the length of X and Y.

Example 2: Knapsack Problem

- We have n items with weights and values:

Item:					
Weight:	6	2	4	3	11
Value:	20	8	14	13	35

- And we have a knapsack:
 - it can only carry so much weight:

Capacity: 10

Capacity: 10

Item:

Weight:

6

2

4

3

11

Value:

20

8

14

13

35

• Unbounded Knapsack:

- Suppose I have **infinite copies** of all of the items.
- What's the **most valuable way to fill the knapsack?**

Total weight: 10

Total value: 42

• 0/1 Knapsack:

- Suppose I have **only one copy** of each item.
- What's the **most valuable way to fill the knapsack?**

Total weight: 9

Total value: 35

Some notation

Item:

Weight:

 w_1 w_2 w_3 \dots w_n

Value:

 v_1 v_2 v_3 v_n 

Capacity: W

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

Optimal substructure

- Sub-problems:
 - Unbounded Knapsack with a smaller knapsack.
 - $K[x] = \max$ value you can fit in a knapsack of capacity x

First solve the problem for small knapsacks

Then larger knapsacks

Then larger knapsacks

What's the relationship between bigger and smaller problems?

item i

- Suppose this is an optimal solution for capacity x (and it includes item i):

Weight w_i
Value v_i

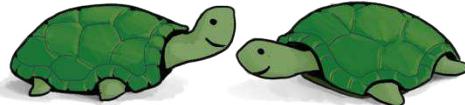

Capacity x
Value V

- Then this optimal for capacity $x - w_i$:

Capacity $x - w_i$
Value $V - v_i$

Why?

What's the relationship between bigger and smaller problems?

item i

- Suppose this is an optimal solution for capacity x (and it includes item i):

Weight w_i
Value v_i

Capacity x
Value V

- Then this optimal for capacity $x - w_i$:

Capacity $x - w_i$
Value $V - v_i$

If we could do better than the second solution, then adding a turtle to that improvement would improve the first solution!

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

Recursive relationship

- $K[x]$ is the optimal value for capacity x .

$$K[x] = \max_i \{$$

The maximum is over
all i so that $w_i \leq x$.

+

Optimal way to
fill a smaller
knapsack

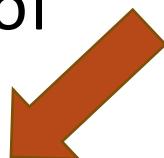

The value of
item i .

$$K[x] = \max_i \{ K[x - w_i] + v_i \}$$

- (And $K[x] = 0$ if the maximum is empty).
 - That is, if there are no i so that $w_i \leq x$

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

Let's write a bottom-up DP algorithm

- UnboundedKnapsack(W, n, weights, values):
 - Initialize K of length W+1, $K[0] = 0$
 - **for** $x = 1, \dots, W$:
 - $K[x] = 0$
 - **for** $i = 1, \dots, n$:
 - **if** $w_i \leq x$:
 - $K[x] = \max\{ K[x], K[x - w_i] + v_i \}$
 - **return** $K[W]$

Running time: $O(nW)$

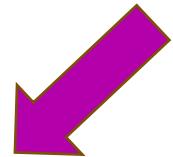

$$\begin{aligned} K[x] &= \max_i \{ \text{backpack icon} + \text{turtle icon} \} \\ &= \max_i \{ K[x - w_i] + v_i \} \end{aligned}$$

Can we do better than $O(nW)$?

- Input size: $O(n \log W)$ bits.
 - Writing down “W” takes $\log_2 W$ bits.
 - Writing down all n weights takes at most $n \log_2 W$ bits.
- Maybe we could have an algorithm that runs in time $O(n \log W)$ instead of $O(nW)$?
 - Or even $O((n \log W)^{10000000})$?
- Getting time polynomial in $n \log W$ is an open problem!
 - But probably the answer is **no**...otherwise $P = NP$

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

Let's write a bottom-up DP algorithm

- UnboundedKnapsack(W, n, weights, values):
 - $K[0] = 0$
 - **for** $x = 1, \dots, W$:
 - $K[x] = 0$
 - **for** $i = 1, \dots, n$:
 - **if** $w_i \leq x$:
 - $K[x] = \max\{ K[x], K[x - w_i] + v_i \}$
 - **return** $K[W]$

$$K[x] = \max_i \{ \text{backpack icon} + \text{turtle icon} \}$$
$$= \max_i \{ K[x - w_i] + v_i \}$$

Let's write a bottom-up DP algorithm

- UnboundedKnapsack(W, n, weights, values):

- $K[0] = 0$
- $\text{ITEMS}[0] = \emptyset$
- **for** $x = 1, \dots, W$:
 - $K[x] = 0$
 - **for** $i = 1, \dots, n$:
 - **if** $w_i \leq x$:
 - $K[x] = \max\{ K[x], K[x - w_i] + v_i \}$
 - **If** $K[x]$ was updated:
 - $\text{ITEMS}[x] = \text{ITEMS}[x - w_i] \cup \{ \text{item } i \}$
 - **return** $\text{ITEMS}[W]$

Idea: Keep an another array, ITEMS, so that $\text{ITEMS}[x]$ stores the optimal solution (a list of items) for capacity x .

$$K[x] = \max_i \{ \text{backpack icon} + \text{turtle icon} \}$$
$$= \max_i \{ K[x - w_i] + v_i \}$$

Example

	0	1	2	3	4
K	0				
ITEMS					

- **UnboundedKnapsack(W, n, weights, values):**
 - $K[0] = 0$
 - $\text{ITEMS}[0] = \emptyset$
 - **for** $x = 1, \dots, W:$
 - $K[x] = 0$
 - **for** $i = 1, \dots, n:$
 - **if** $w_i \leq x:$
 - $K[x] = \max\{ K[x], K[x - w_i] + v_i \}$
 - **If** $K[x]$ was updated:
 - $\text{ITEMS}[x] = \text{ITEMS}[x - w_i] \cup \{ \text{item } i \}$

 - **return** $\text{ITEMS}[W]$

Item:			
Weight:	1	2	3
Value:	1	4	6

So the optimal solution is , with value 8

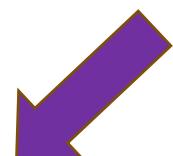

Capacity: 4

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

(Pass)

What have we learned?

- We can solve unbounded knapsack in time $O(nW)$.
 - If there are n items and our knapsack has capacity W .
- We again went through the steps to create DP solution:
 - We kept a one-dimensional table, creating smaller problems by making the knapsack smaller.

Capacity: 10

Item:

Weight:

6

2

4

3

11

Value:

20

8

14

13

35

- Unbounded Knapsack:

- Suppose I have **infinite copies** of all of the items.
- What's the **most valuable way to fill the knapsack?**

Total weight: 10

Total value: 42

- 0/1 Knapsack:

- Suppose I have **only one copy** of each item.
- What's the **most valuable way to fill the knapsack?**

Total weight: 9

Total value: 35

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

Optimal substructure: try 1

- Sub-problems:
 - Unbounded Knapsack with a smaller knapsack.

First solve the
problem for
small knapsacks

Then larger
knapsacks

Then larger
knapsacks

This won't quite work...

- We are only allowed **one copy of each item**.
- The sub-problem needs to “know” what items we’ve used and what we haven’t.

Optimal substructure: try 2

- Sub-problems:
 - 0/1 Knapsack with fewer items.

First solve the problem with few items

We'll still increase the size of the knapsacks.

Then more items

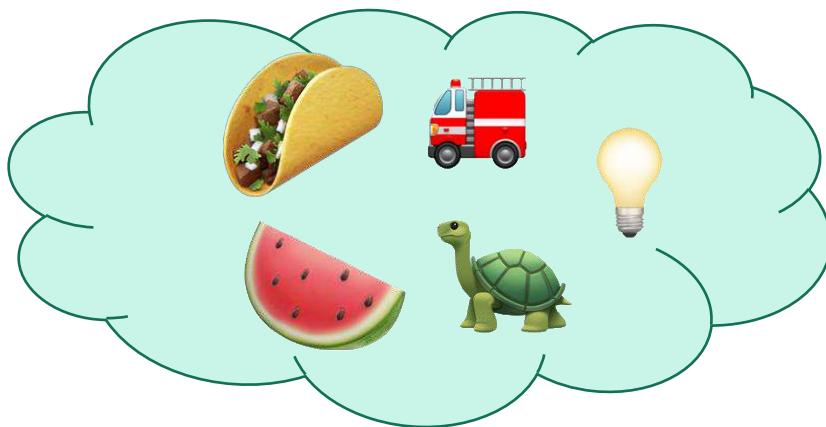

(We'll keep a two-dimensional table).

Then yet more items

Our sub-problems:

- Indexed by x and j

First j items

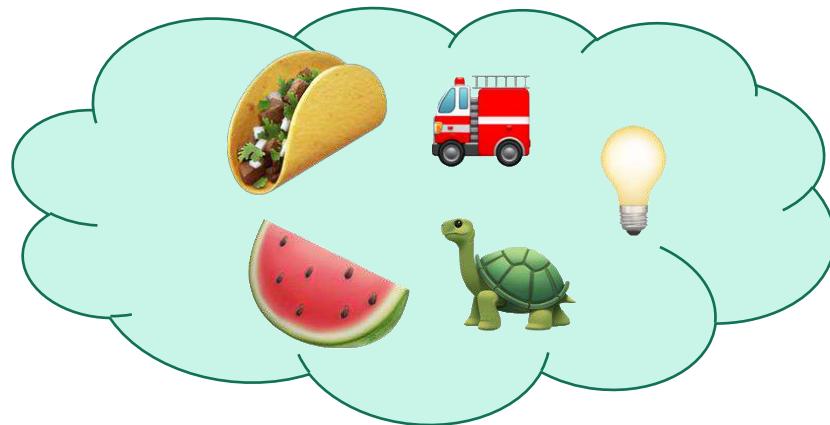

Capacity x

$K[x,j]$ = optimal solution for a knapsack of size x using only the first j items.

Relationship between sub-problems

- Want to write $K[x,j]$ in terms of smaller sub-problems.

First j items

Capacity x

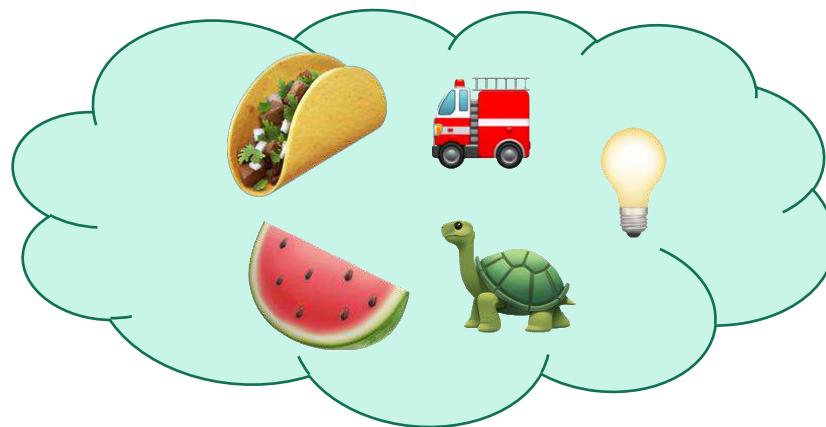

$K[x,j] = \text{optimal solution for a knapsack of size } x \text{ using only the first } j \text{ items.}$

Two cases

item j

- **Case 1:** Optimal solution for j items does not use item j.
- **Case 2:** Optimal solution for j items does use item j.

First j items

Capacity x

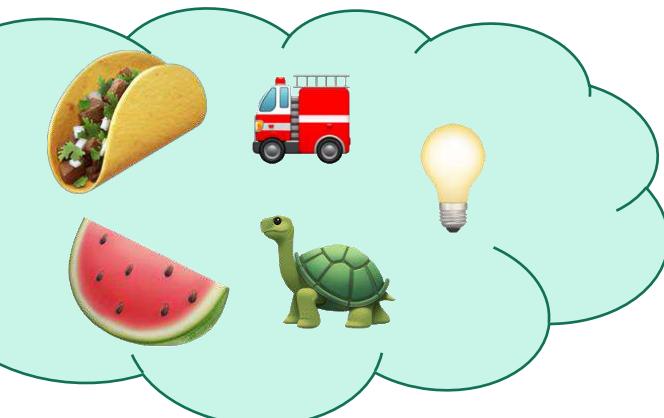

$K[x,j]$ = optimal solution for a knapsack of size x using only the first j items.

Two cases

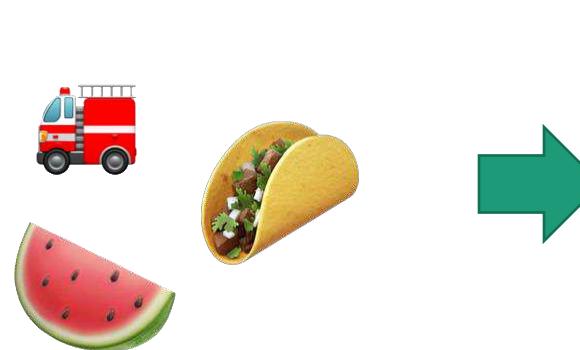

item j

- **Case 1:** Optimal solution for j items does not use item j.

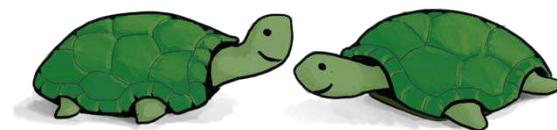

First j items

Capacity x
Value V
Use only the first j items

What lower-indexed problem
should we solve to solve this
problem?

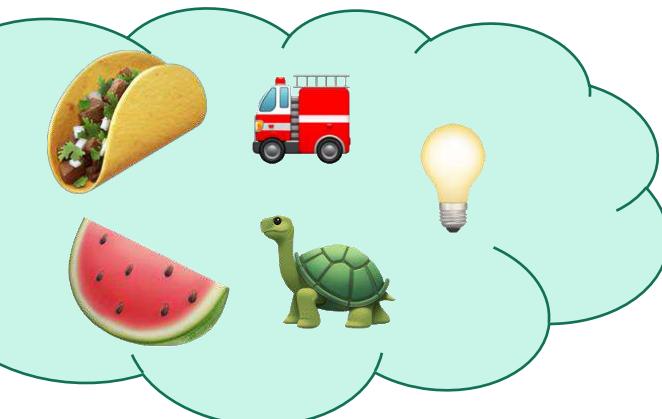

Two cases

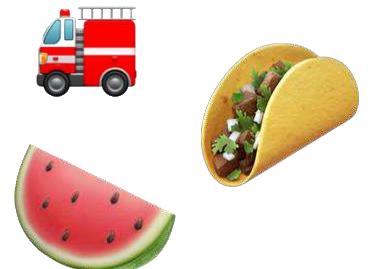

item j

- **Case 1:** Optimal solution for j items does not use item j.

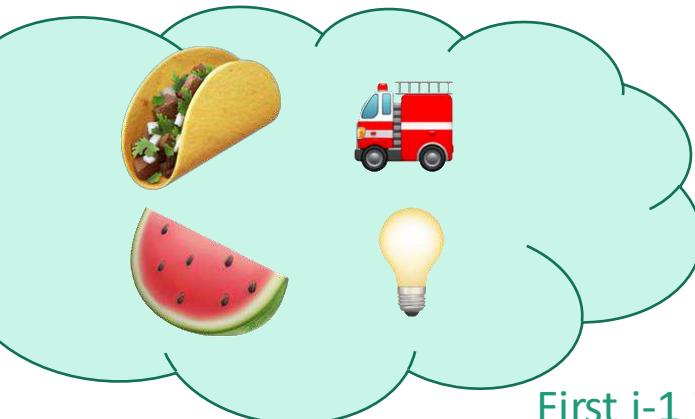

First j items

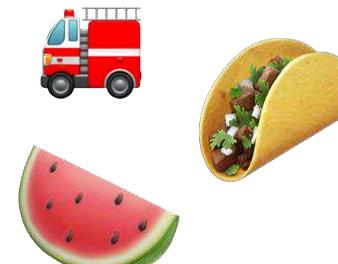

Capacity x
Value V
Use only the first j items

- Then this is an optimal solution for $j-1$ items:

First $j-1$ items

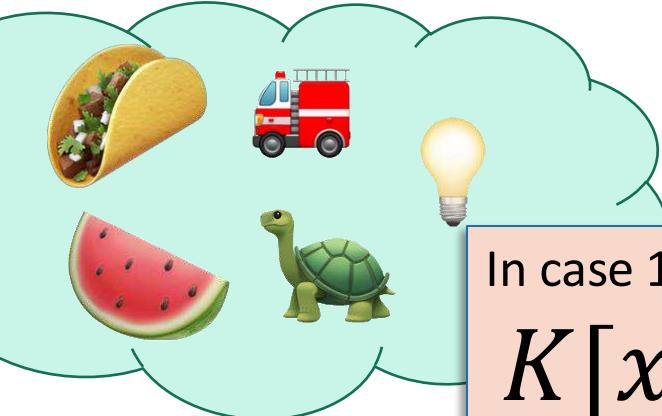

Capacity x
Value V
Use only the first $j-1$ items.

Two cases

item j

- **Case 1:** Optimal solution for j items does not use item j.

First j items

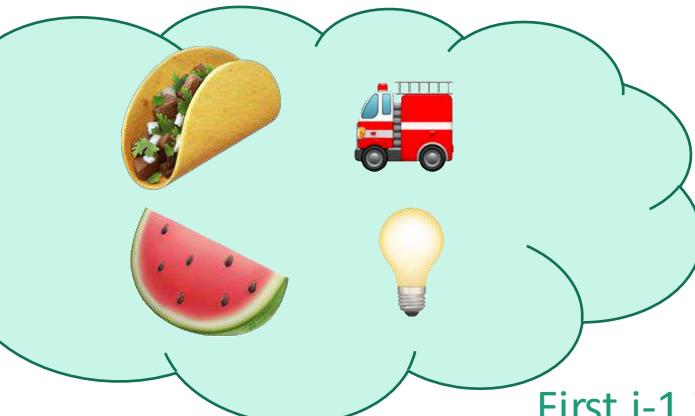

In case 1:

$$K[x, j] = K[x, j - 1]$$

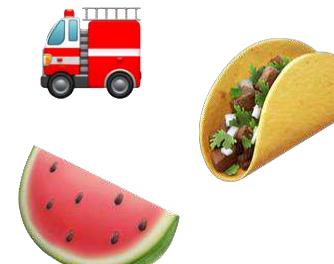

Capacity x
Value V

Use only the first j items

- Then this is an optimal solution for $j-1$ items:

First j-1 items

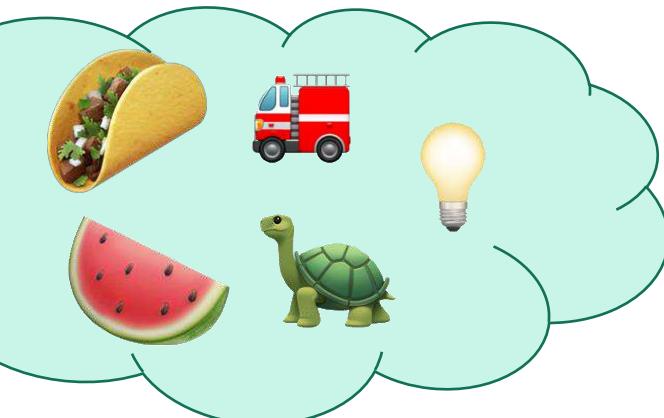

Capacity x
Value V
Use only the first j-1 items.

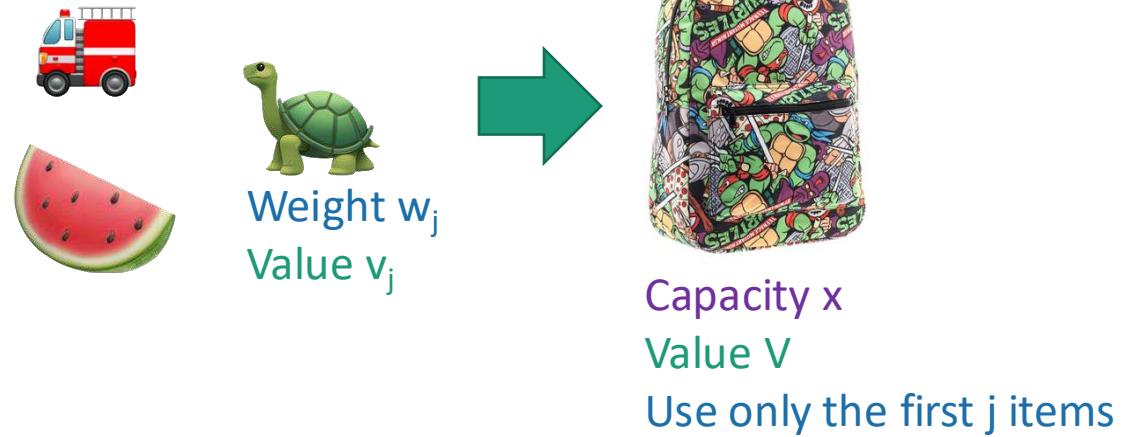

Two cases

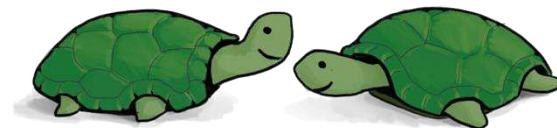

- **Case 2:** Optimal solution for j items uses item j .

First j items

What lower-indexed problem
should we solve to solve this
problem?

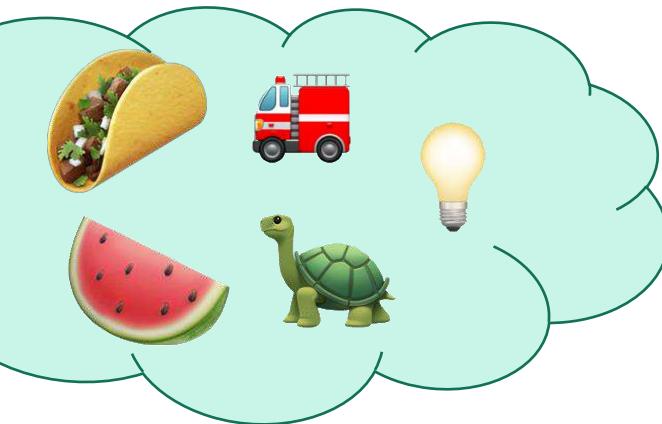

Two cases

item j

- **Case 2:** Optimal solution for j items uses item j.

First j items

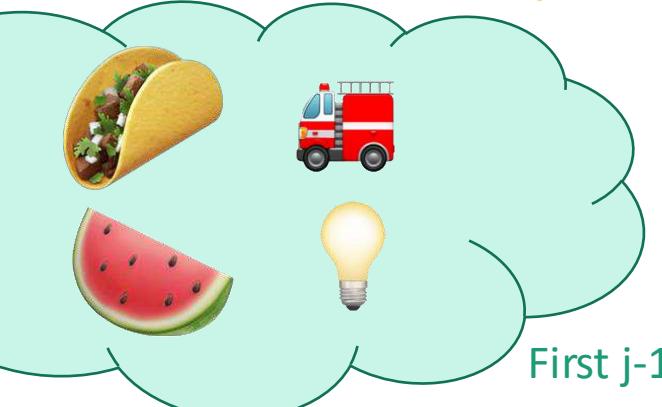

Weight w_j
Value v_j

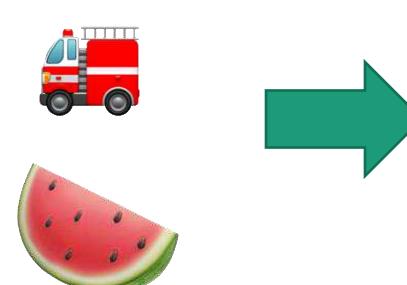

Capacity x
Value V
Use only the first j items

- Then this is an optimal solution for $j-1$ items and a smaller knapsack:

First $j-1$ items

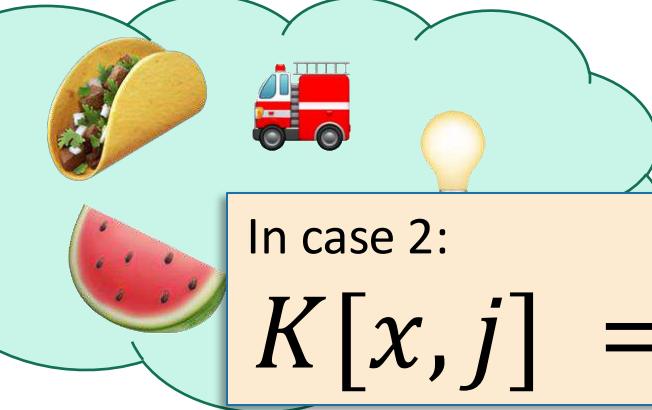

Capacity $x - w_j$
Value $V - v_j$
Use only the first $j-1$ items.

Two cases

item j

- **Case 2:** Optimal solution for j items uses item j.

In case 2:

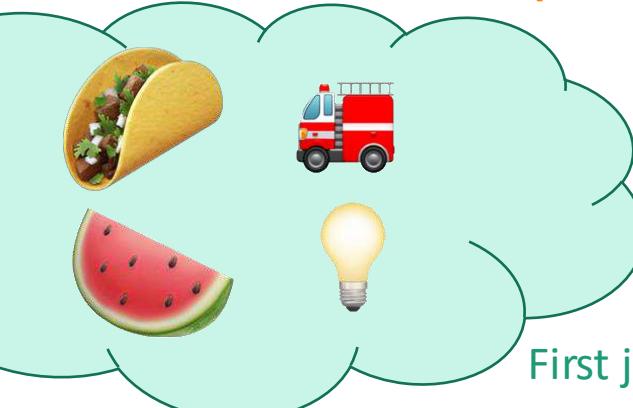

$$K[x, j] = K[x - w_j, j - 1] + v_j$$

First j items

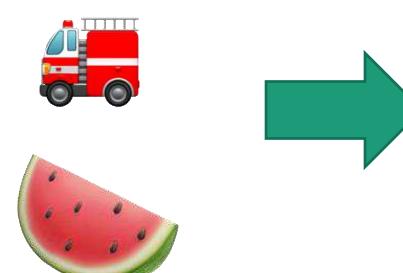

Use only the first j items

- Then this is an optimal solution for $j-1$ items and a smaller knapsack:

First $j-1$ items

Capacity $x - w_j$

Value $V - v_j$

Use only the first $j-1$ items.

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

Recursive relationship

- Let $K[x,j]$ be the optimal value for:
 - capacity x ,
 - with j items.

$$K[x,j] = \max\{ K[x, j-1] , K[x - w_j, j-1] + v_j \}$$

Case 1

Case 2

- (And $K[x,0] = 0$ and $K[0,j] = 0$).

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

Bottom-up DP algorithm

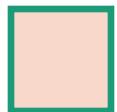

- Zero-One-Knapsack(W, n, w, v):
 - $K[x,0] = 0$ for all $x = 0, \dots, W$
 - $K[0,i] = 0$ for all $i = 0, \dots, n$
 - **for** $x = 1, \dots, W$:
 - **for** $j = 1, \dots, n$:
 - $K[x,j] = K[x, j-1]$ Case 1
 - **if** $w_j \leq x$:
 - $K[x,j] = \max\{ K[x,j], K[x - w_j, j-1] + v_j \}$ Case 2
 - **return** $K[W,n]$

Running time $O(nW)$

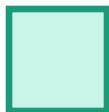

Example

x=0 x=1 x=2 x=3

	x=0	x=1	x=2	x=3

So the optimal solution is to put one watermelon in your knapsack!

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

You do this one!

(We did it on the slide in the previous example, just not in the pseudocode!)

What have we learned?

- We can solve 0/1 knapsack in time $O(nW)$.
 - If there are n items and our knapsack has capacity W .
- We again went through the steps to create DP solution:
 - We kept a two-dimensional table, creating smaller problems by restricting the set of allowable items.

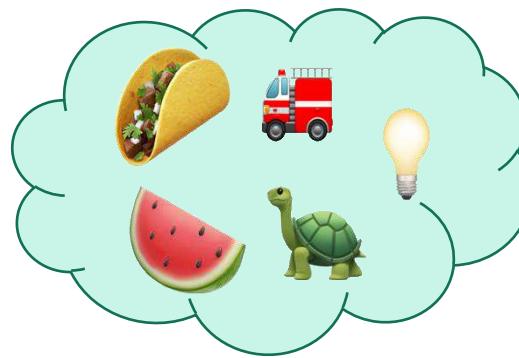

Question

- How did we know which substructure to use in which variant of knapsack?

Answer in retrospect:

VS.

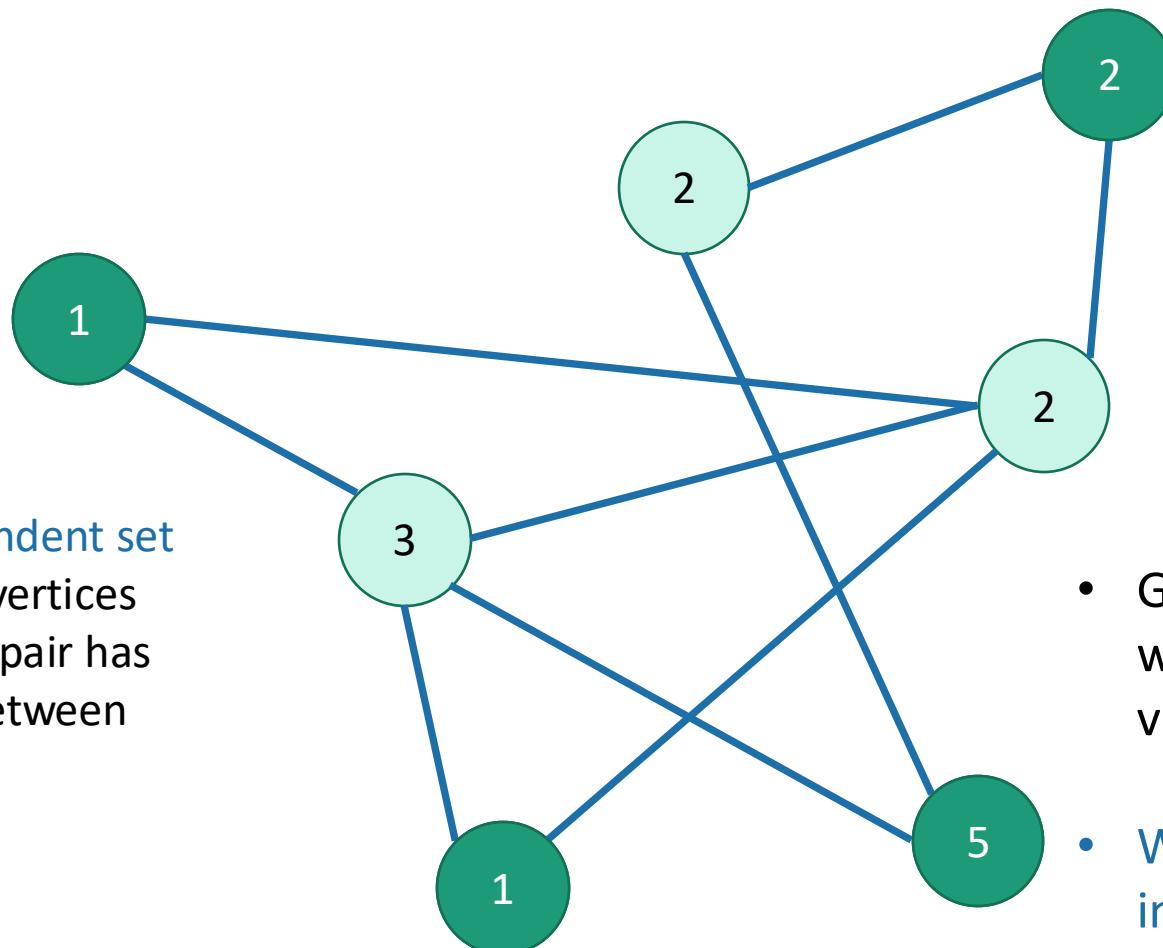

This one made sense for unbounded knapsack because it doesn't have any memory of what items have been used.

In 0/1 knapsack, we can only use each item once, so it makes sense to leave out one item at a time.

Operational Answer: try some stuff, see what works!

Example 3: Independent Set

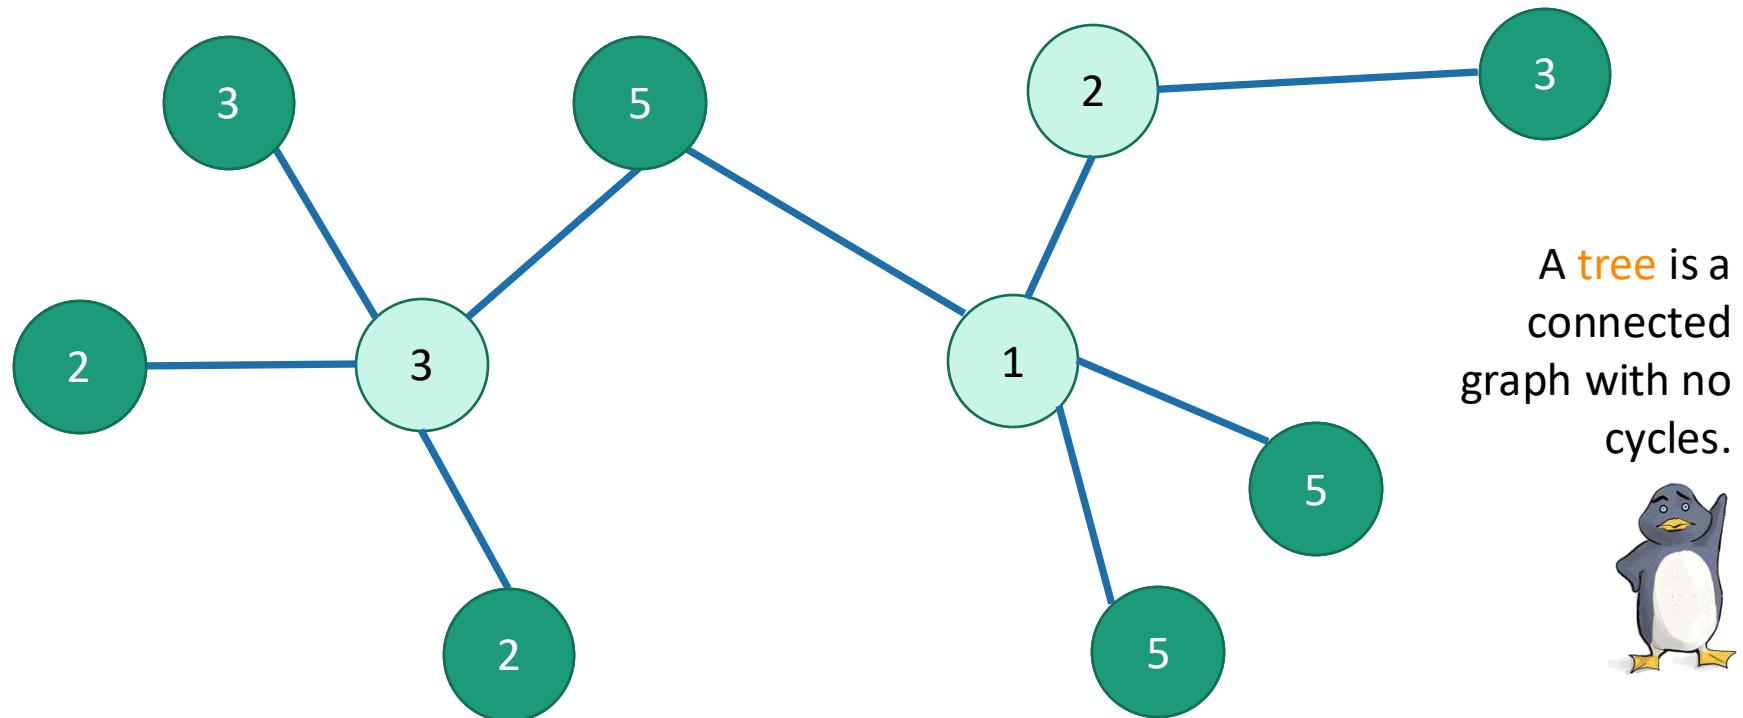

if we still have time

- Given a graph with weights on the vertices...
- What is the independent set with the largest weight?

Actually this problem is NP-complete.
So we are unlikely to find an efficient algorithm

- But if we also assume that the graph is a tree...

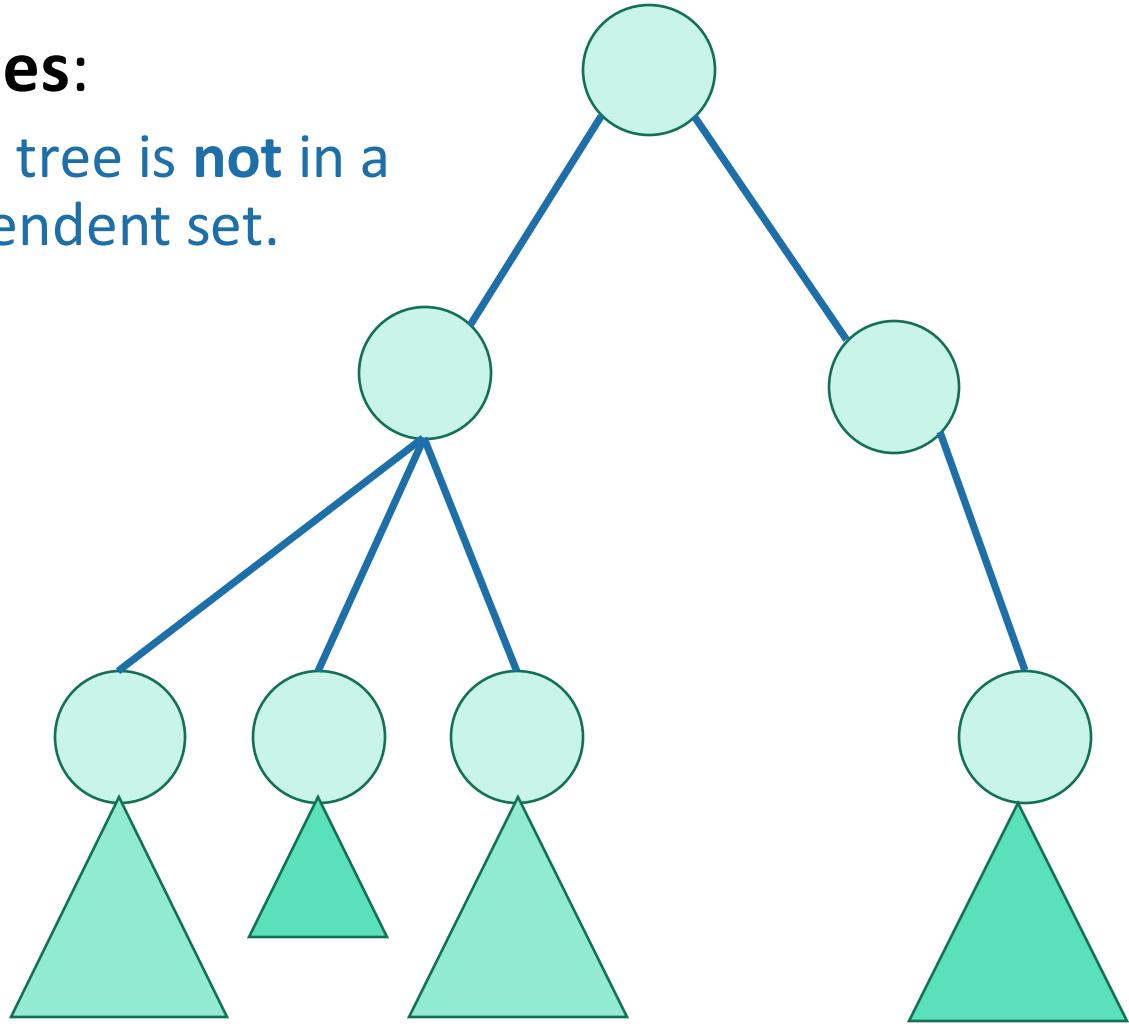

find a maximal independent set in a tree (with vertex weights)¹⁰⁹

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure. 
- **Step 2:** Find a recursive formulation for the value of the optimal solution
- **Step 3:** Use dynamic programming to find the value of the optimal solution
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

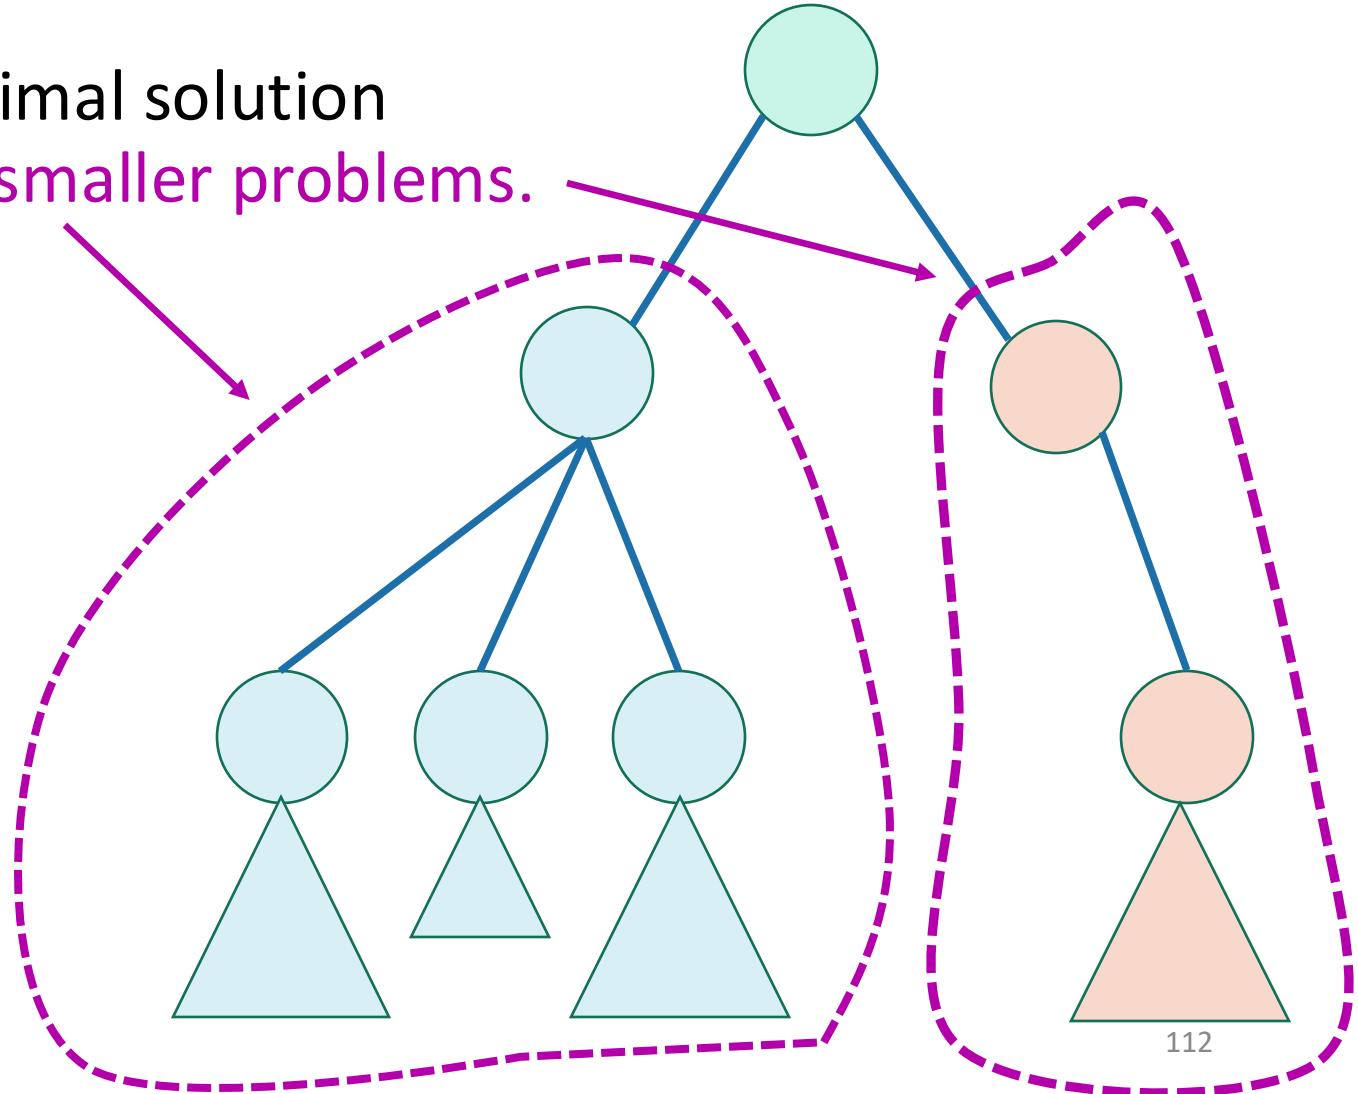

Optimal substructure

- Subtrees are a natural candidate.
- There are **two cases**:
 1. The root of this tree is **not** in a maximal independent set.
 2. Or it is.

Case 1: the root is not in an maximal independent set

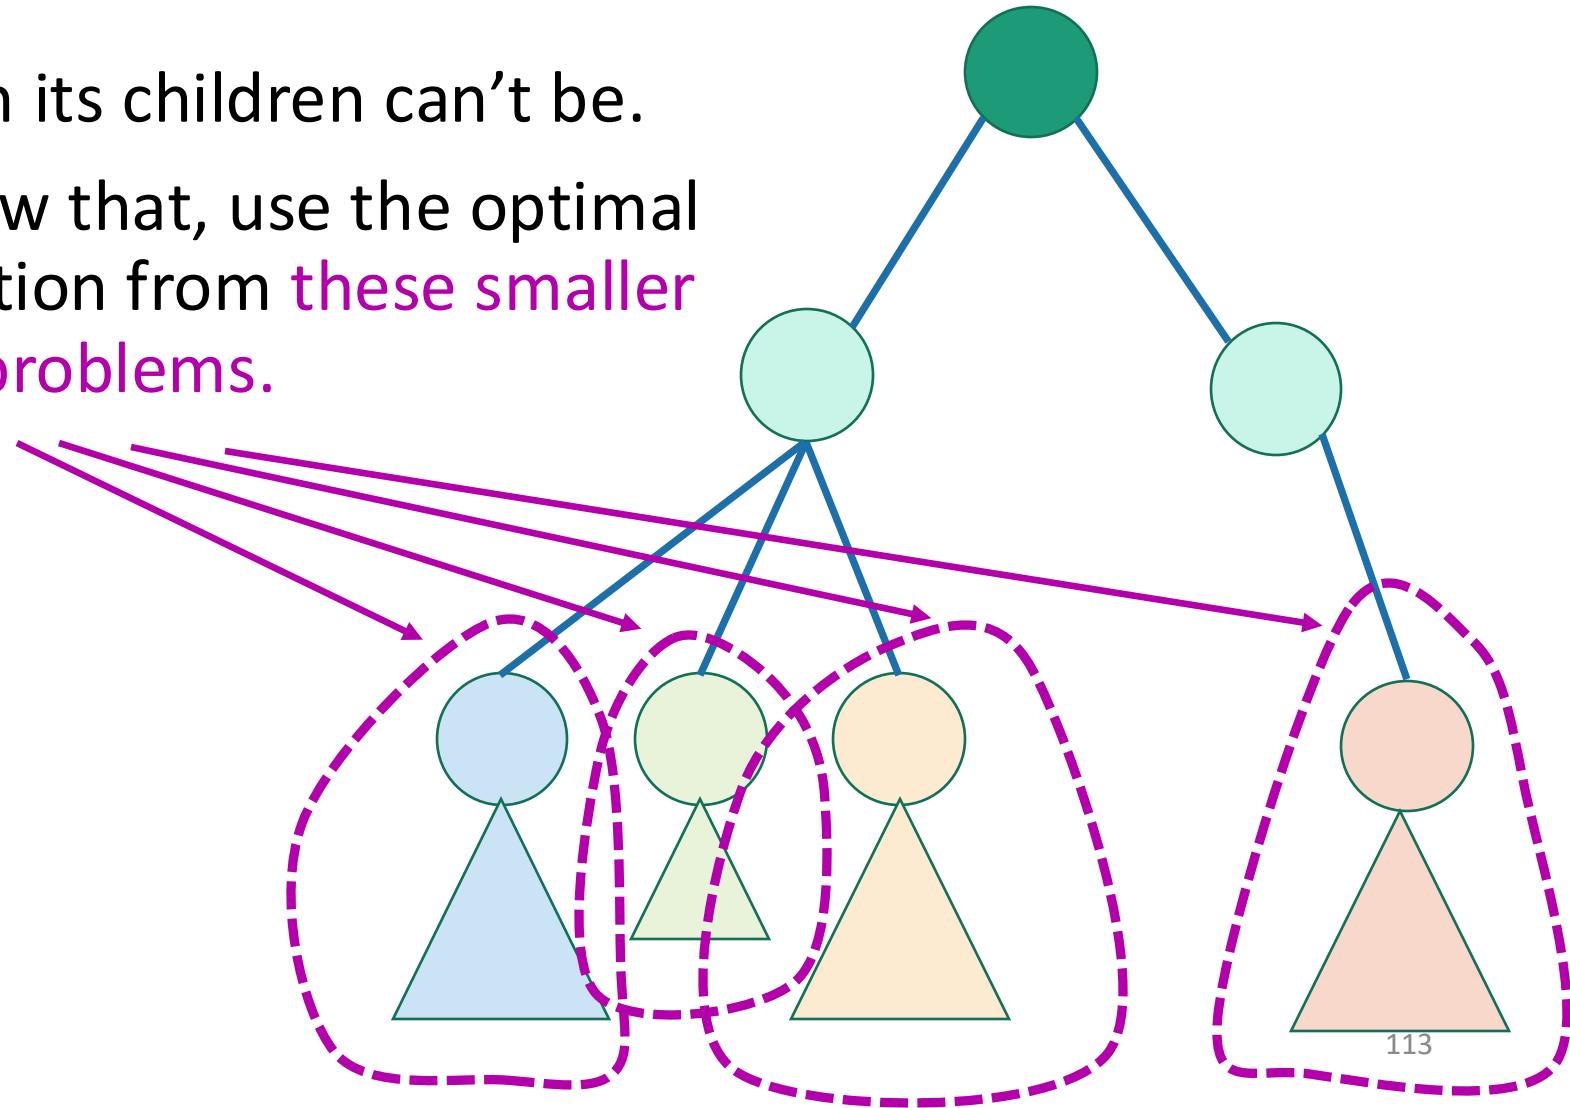

- Use the optimal solution
from **these smaller problems.**

Case 2:

the root is in an maximal independent set

- Then its children can't be.
- Below that, use the optimal solution from **these smaller subproblems**.

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

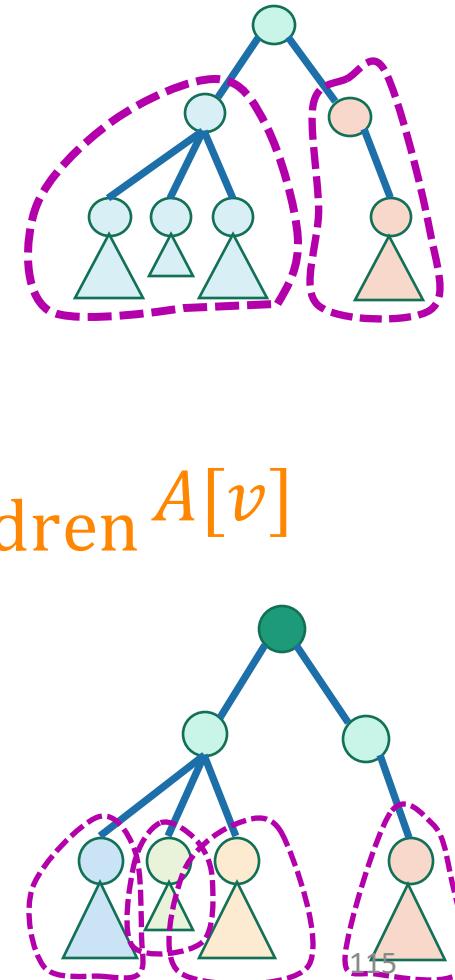

Recursive formulation

- Let $A[u]$ be the weight of a maximal independent set in the tree rooted at u .

- $$A[u] = \max \left\{ \begin{array}{l} \sum_{v \in u.\text{children}} A[v] \\ \text{weight}(u) + \sum_{v \in u.\text{grandchildren}} A[v] \end{array} \right.$$

When we implement this, how do we keep track of **this term**?

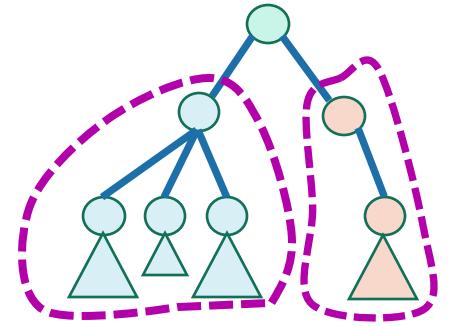

Slightly cleaner version

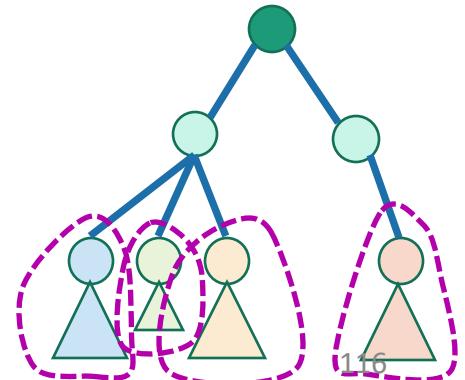

Keep two arrays!

- Let $A[u]$ be the weight of a maximal independent set in the tree rooted at u .
- Let $B[u] = \sum_{v \in u.\text{children}} A[v]$

$$\bullet A[u] = \max \left\{ \begin{array}{l} \sum_{v \in u.\text{children}} A[v] \\ \text{weight}(u) + \sum_{v \in u.\text{children}} B[v] \end{array} \right.$$

This saves on pointer-chasing, and also has a nice interpretation: $B[v]$ is “the weight of a maximal independent set in the tree rooted at u , if u is not in the MIS.”

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

A top-down DP algorithm

- MIS_subtree(u):
 - if u is a leaf:
 - $A[u] = \text{weight}(u)$
 - $B[u] = 0$
 - else:
 - for v in $u.\text{children}$:
 - MIS_subtree(v)
 - $A[u] = \max\{\sum_{v \in u.\text{children}} A[v], \text{weight}(u) + \sum_{v \in u.\text{children}} B[v]\}$
 - $B[u] = \sum_{v \in u.\text{children}} A[v]$
 - MIS(T):
 - MIS_subtree($T.\text{root}$)
 - return $A[T.\text{root}]$
- Initialize global arrays A, B that we will use in all of the recursive calls.*
- Running time?**

 - We visit each vertex once, and at every vertex we do $O(1)$ work:
 - Make a recursive call
 - look stuff up in tables
 - Running time is $O(|V|)$
- 118

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

You do this one!

What have we learned?

- We can find maximal independent sets in trees in time $O(|V|)$ using dynamic programming!
- For this example, it was natural to implement our DP algorithm in a top-down way.

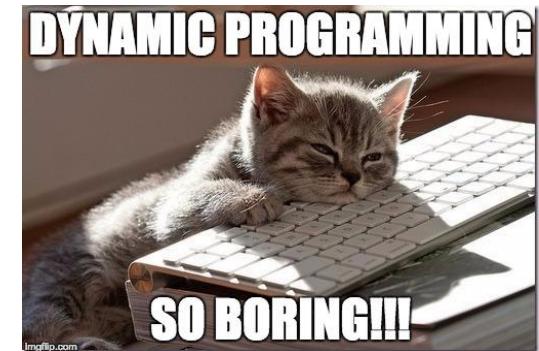

Recap

- Today we saw examples of how to come up with dynamic programming algorithms.
 - Longest Common Subsequence
 - Knapsack two ways
 - (If time) maximal independent set in trees.
 - If not time, that's fine! Feel free to check out the slides if you want more examples of DP.
- There is a **recipe** for dynamic programming algorithms.

Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

Recap

- Today we saw examples of how to come up with dynamic programming algorithms.
 - Longest Common Subsequence
 - Knapsack two ways
 - (If time) maximal independent set in trees.
- There is a **recipe** for dynamic programming algorithms.
- Sometimes coming up with the right substructure takes some creativity
 - Lots of practice on HW6!!! 😊
 - For even more practice check out additional examples/practice problems in Algorithms Illuminated or CLRS or section!

Next time

- Greedy algorithms!

Before next time

- Pre-lecture exercise: Greed is good!
